

std::char_traits< unsigned char >

std::char_traits< char >

detail::char_traits< unsigned char >

```
graph BT; A[detail::char_traits< unsigned char >] --> B[std::char_traits< unsigned char >]; A --> C[std::char_traits< char >];
```

The diagram illustrates the relationship between three C++ char_traits specializations. At the bottom is a box for 'detail::char_traits< unsigned char >'. Two arrows originate from this box: one points up to 'std::char_traits< unsigned char >' on the left, and the other points up to 'std::char_traits< char >' on the right. This indicates that the detail namespace specialization is the common base for both standard namespace specializations.
